

Subject: Critical Security Vulnerability Identified

Dear Development Team,

During a recent security assessment, we identified a critical vulnerability (CVE-2021-41773) affecting the Apache web server on host 192.168.1.100. This issue allows attackers to perform path traversal attacks and access restricted files, potentially leading to sensitive data exposure.

Proof of Concept (PoC):

Accessing crafted URLs allowed retrieval of restricted system files.

We strongly recommend applying the latest Apache security patches immediately and restricting unnecessary access permissions. Additionally, review server configurations to prevent unauthorized access.

Please prioritize this issue due to its critical severity.

**Best regards,
Security Analyst**
